Qualitative analysis methods of disposal and waste management in hospitals
Dralvdgy environmental impact of hospital waste

Hospitals and medical centers are the most important centers of production of hazardous wastes. At hospitals there are different therapeutic approaches such as: Chemotherapy, Dialysis, Amputation, Removing the internal organs, Cobalt therapy, Chemical tests and ... Performed on patients; Waste treatment in health centers which Produced In hospitals, Laboratories, and clinics Due to contamination and losses are resulting from lack of health management that are causing the increase and spread of dangerous diseases and is contagious and threat to human health and the environment. In this study, we discussed different methods of hospital disposal waste characterized in Iran and also in Europe, and studied safe storage methods and waste separation with disadvantages and benefits in Iran and other Countries. Then explained waste management as an important factor. Results of research shows that today despite increase the amount of waste and environmental pollution and its associated with health risks, as one of the main problems of human societies has been introduced. We should pay serious attention to this issue. It need to cooperation and coordination of all relevant institutions.
