عنوان مقاله:
The World Climate Programme

محل انتشار:
دومین کنفرانس منطقه‌ای تغییر اقلیم (سال:1378)

تعداد صفحات اصل مقاله: 4 صفحه

نویسنده:
Michael J.Coughlan - World Meteorological Organization, Geneva, Switzerland

خلاصه مقاله:
From its inception in 1950, the World Meteorological Organization had inherited a long and proud tradition in Climatology from its predecessor, the International Meteorological Organization. Since the time that meteorological observations began in a systematic way during the latter half of the 19th century, there was a realisation of the enormous potential wealth that would accrue from the logging and archival of the data. As the early databases grew, in terms of the number of stations and the record lengths, this potential began to be realised through a wide range of applications of the data. These applications included agriculture, human-health, building design and, by the meteorological community itself, improving the understanding of its own science and in particular the ability to develop -euristic models with which to forecast the weather.
